Matrix 1.7.1

ai25btech11015 – M Sai Rithik

Question

Show that the points $(0,0)$, $(2m,-4)$, and $(3,6)$ are collinear, and hence find m, using the rank method.

Solution

Let the given points be

$$A = (0,0), \quad B = (2m,-4), \quad C = (3,6).$$

Step 1: Form vectors

$$AB = B - A = \begin{bmatrix} 2m \\ -4 \end{bmatrix}, \quad AC = C - A = \begin{bmatrix} 3 \\ 6 \end{bmatrix}.$$

Step 2: Matrix form

Construct the matrix

$$M = \begin{bmatrix} 2m & 3 \\ -4 & 6 \end{bmatrix}.$$

For the points to be collinear, the two vectors AB and AC must be linearly dependent. This means

$$\text{rank}(M) = 1 \quad \Leftrightarrow \quad \det(M) = 0.$$

$$M = \begin{bmatrix} 2m & 3 \\ -4 & 6 \end{bmatrix}.$$

We use RREF M and look for when its rank drops below 2.

$$\begin{bmatrix} 2m & 3 \\ -4 & 6 \end{bmatrix} \xrightarrow{R_1 \leftrightarrow R_2} \begin{bmatrix} -4 & 6 \\ 2m & 3 \end{bmatrix} \xrightarrow{R_1 \leftarrow -\frac{1}{4}R_1} \begin{bmatrix} 1 & -\frac{3}{2} \\ 2m & 3 \end{bmatrix}$$

$$\xrightarrow{R_2 \leftarrow R_2 - 2m\,R_1} \begin{bmatrix} 1 & -\frac{3}{2} \\ 0 & 3(m+1) \end{bmatrix}.$$

If $m \neq -1$, the second row has a pivot (divide by $3(m+1)$), so the RREF is I_2 and $\text{rank}(M) = 2$. For the rank to drop (and hence the RREF to have a zero row), we need

$$3(m+1) = 0 \quad \Rightarrow \quad m = -1.$$

When $m = -1$,

$$\begin{bmatrix} 1 & -\frac{3}{2} \\ 0 & 0 \end{bmatrix}$$

is the reduced row-echelon form (rank = 1).

Final Answer

The given points are collinear when

$$\boxed{m = -1}$$
