Question

The line segment joining the points $A(2, 1)$ and $B(5, -8)$ is trisected at the points P and Q , where P is nearer to A . If P lies on the line

$$2x - y + k = 0,$$

find the value of k . Use matrix / linear-algebra concepts only.

Solution

Write the position vectors of the points using column matrices:

$$\mathbf{A} = \begin{pmatrix} 2 \\ 1 \end{pmatrix}, \quad \mathbf{B} = \begin{pmatrix} 5 \\ -8 \end{pmatrix}. \quad (1)$$

The vector from A to B is

$$\mathbf{B} - \mathbf{A} = \begin{pmatrix} 5 \\ -8 \end{pmatrix} - \begin{pmatrix} 2 \\ 1 \end{pmatrix} = \begin{pmatrix} 3 \\ -9 \end{pmatrix}. \quad (2)$$

Trisecting the segment AB means the first trisection point P (closer to A) is obtained by moving one third of the way from A toward B . In vector form

$$\mathbf{P} = \mathbf{A} + \frac{1}{3}(\mathbf{B} - \mathbf{A}). \quad (3)$$

Substitute (??) and (??) into (??):

$$\mathbf{P} = \begin{pmatrix} 2 \\ 1 \end{pmatrix} + \frac{1}{3} \begin{pmatrix} 3 \\ -9 \end{pmatrix} = \begin{pmatrix} 2 \\ 1 \end{pmatrix} + \begin{pmatrix} 1 \\ -3 \end{pmatrix} = \begin{pmatrix} 3 \\ -2 \end{pmatrix}. \quad (4)$$

Thus the co-ordinates of P are $(3, -2)$. Since P lies on the line $2x - y + k = 0$, substitute $x = 3$, $y = -2$ into the line equation:

$$2(3) - (-2) + k = 0. \quad (5)$$

Solve (??) for k :

$$6 + 2 + k = 0 \implies k = -8. \quad (6)$$

Final Answer

$$\boxed{k = -8} \quad (7)$$
